[COMPANY] is already in Initial Implementation

Four weeks

From that declaration to assessment-ready

A FOUR-PHASE PROCESS

PHASE 1

Connect your systems

Read-only connectors into AWS, Azure and GCP, plus identity, code and security sources.

PHASE 2

See your posture

Every KSI and requirement evaluated against the live environment.

PHASE 3

Agent remediation

Agents draft the fixes for failing KSIs, human-reviewed, then revalidated.

PHASE 4

Demonstrate and get assessed

Your new posture published on a public trust center, with the package ready for your assessor to validate.

**A declaration only becomes a
listing once the assessment is done**

Why [COMPANY], why now

What a 20x Class C (Moderate) certification asks for, why the window matters, and how [COMPANY] gets there on evidence from its own environment.

THE CASE IN FOUR PARTS

Who is [COMPANY]?

- [COMPANY] is a [COMPANY DESCRIPTOR] selling to [BUYER], at [STAGE].
- Current baseline to build on: [SOC 2 / ISO 27001], with [AGENCY DEMAND] pulling them in.
- [OFFERING] is the system in scope, with federal interest already in the pipeline.

FedRAMP 20x creates a major new opportunity

- Class C certification in 2–3 months, against 12–18 for Rev5 Moderate.
- Roughly \$100K–\$300K to certify, against \$500K–\$1.5M.
- Automated validation and machine-readable evidence replace most of the documentation burden, putting federal authorization within reach for far more providers.

Why act now?

- A certification opens the door to selling to federal agencies at all: unlisted services cannot be bought.
- 20x removes the agency-sponsor barrier, so [COMPANY] can pursue that market directly.
- First movers win the category: agencies buy from vendors already listed, before competitors arrive.

Why Boundera?

- Assessment-ready in four weeks: Boundera turns your environment into validated KSI evidence.
- AI-assisted remediation drafts fixes for failing KSIs and revalidates them.
- Continuously collects evidence and produces the necessary machine-readable packages.
